Membrane vesicles are useful for immunotherapy treatment or prophylaxis of tumours, and for treating various disease conditions such as cancer, infections, and immune diseases. This sequence represents an OVA peptide fragment which is contacted with an exosome, to create an immunogenic membrane vesicle.
The invention relates to a vector (a pGA construct) comprising a termination sequence coding for the lambda 70 terminator, a prokaryotic origin of replication, a selectable marker gene and a eukaryotic transcription cassette comprising a vaccine insert encoding one or more immunogens derived from a pathogen e.g. Human Immunodeficiency Virus (HIV) Gag, HIV gp120, HIV PG1, HIV Env, HIV VLP, or its mutants, measles fusion protein, measles haemagglutinin, measles mucleoprotein, influenza haemagglutinin, or its mutants, or subsequences, and optionally at least one C3d gene, is useful for immunising or treating a patient, when administered by an intramuscular or intradermal route. The immunisation methods using pGA elicit both cell-mediated and humoral immune responses that may limit the infection, spread or growth of the pathogen and result
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TO terminator; pGA; DNA vaccine; anti-HIV; virucide;

                                                                                                                                                          in protection against subsequent challenge against the pathogen. The terminator sequence present prevents read-through from the kanamycin cassette into vaccine sequences while the plasmid is being produced in bacteria. Prevention of transcriptional read-through stabilises vaccine insert sequences by limiting the exposure of secondary structures that can be recognised by bacterial endonucleases. The present sequence is an ovalbumin control peptide used in an experiment to measure the T-cell response in monkeys inoculated with a pGA vector carrying vaccinia

Nucleic acid construct, useful to immunise against various diseases including cancer, expresses the first domain of tetanus toxin FrC fused to a disease peptide antigen to provide a vaccine -WPI; 2002-066370/09 Rice 17-APR-2000; 2000GB-0009470 17-APR-2001; 2001WO-GB01719. (CANC-) Ġ CANCER RES VENTURES LTD

Disclosure; Page 25; 71pp; English

The invention relates to a nucleic acid construct for delivery into living cells in vivo, to induce an immune response to a disease peptide antigen, where the construct directs expression of a fusion protein comprising the peptide antigen and the first domain of FrC. Also included are a nucleic acid vector comprising the above construct, a host cell comprising the above construct or vector and a method of producing a nucleic acid construct for inducing an immune response. The method comprises identifying a nucleic acid sequence encoding a disease peptide antigen comprising epitopes characteristic of the disease, cloning the nucleic acid sequence, introducing the cloned nucleic acid into a vector which allows the antigen to be expressed as a fusion with a first domain FrC from tetanus toxin, and optionally isolating the construct from the vector. The construct or vector is used antigens. The present sequence is an immunodominant Kb-restricted cytoroxic T-lymphocyte (CTL) epitope suitable for inclusion in the vaccine of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                    The invention relates to a pharmaceutical preparation comprising a commodified peptide, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SIINFEKL) (one negatively charged (Glu), one positively charged (Lys) amino acid) was crendered negative by adding (at the N-terminus) Glu Glu or Glu Asp Glu Asp, respectively. Results showed that the addition of 4 negatively-charged amino acids (EDED) at the N-terminus of peptide SIINFEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (ITN)-gamma-producing T cells in the Craining (popliteal) lymph node (local response) and in the spleen compared to the addition of hydrophobic amino acids as well as the addition of negatively charged amino acids transforms the peptide SIINFEKL to a good inducer of specific T cells. The modified peptides of the pharmaceutical composition induce a stronger immune cresponse in a mammal compared to wild type antigens. The present cresponse in a mammal compared to wild type attigens. The present compared to produce the modified hydrophobic peptides described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SX

  The present invention relates to a method for increasing antigen-specific CC cytotoxic T lymphocyte (CTL) activity in a CD4+ T cell-deficient CC individual, comprising administering an immunostimulatory sequence CC individual, comprising administering an immunostimulatory sequence CC cinyention are used in CD4+ T cell-deficient individuals to decrease CC tumour load, to treat a primary or acquired immunodeficiency, CC particularly where the acquired immunodeficiency is temporary and due CC to cancer radiotherapy or chemotherapy or immunosuppression following CC to cancer radiotherapy or chemotherapy or immunosuppression following CC or is acquired immunodeficiency, syndrome (AIDS). The nucleic acids may CC weed to treat a person at risk of becoming CD4+ T cell-deficient, CC particularly where someone at risk of cancer recurrence. They are also CC used to treat infection, particularly by an intracellular pathogen, CC M. avium, Epstein-Barr virus, a fungus yeast, varicella zoster virus or thuman immunodeficiency virus (HIV). The present sequence is a hen egg covalbumin (OVA) peptide, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunostimulatory sequence oligonucleotide; ISS-ODN; chemotherapy; immunosuppression; transplantation; autoimmune disease; infection; acquired immune deficiency syndrome; AlDS; intracellular pathogen; cytomegalovirus; mycobacterial infection; Epstein-Barr virus;

                                                                                                                                                                                                                                                                                           The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (HHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin MHC class I epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatibility complex; MHC; therapy; immune response; malignancy; chicken.

                                                                                                             detoxified forms or derivatives, for preparing compositions for immunocompetence, treating autoimmune/infectious disease, stimulating interleukin-5 (II-5)/II-13 production or dampening interfector in mammal. The adjuvant or a pharmaceutical compound containing it is useful for enhancing antibody harvest in a laboratory animal through an elicited Th2 immune responses. The adjuvant is also useful to study the Th2 immune response in laboratory animal through an inaboratory animal ensponse in laboratory animal research, for the treatment or prophylactic vaccination of humans or animals against graft-versushost disease, and for treating tumours. The presents the Ovalbumin (OVA) peptide used as an antigen to stimulate transgenic T cells in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc heterologous promoter and a second gene encoding a different foreign cagent. The nonvirulent bacterium is useful as an intracellular delivery cyclicle, particularly of agents to eukaryotic cells. The nonvirulent cyclic bacterium is particularly useful for delivering foreign agents for characterium is particularly useful for delivering foreign agents for characterium is batterially useful for delivering foreign agents for characterium is also useful for delivering nucleic acids that provide templates for transcription or translation, or provide modulators of transcription and/or translation. No protein purification is required compared to prior art delivery systems. In addition, high levels of compared to prior art delivery systems. In addition, high levels of compared to prior art delivery systems. In addition, high levels of compared to prior art delivery systems. In addition, high levels of conteil can be delivered to the cytosol of virtually any cell and the controlled through the use of inducible promoters. L. compared to include and used as a system to deliver chicken ovalbumin to the cytosol of macrophages. The present sequence represents the chicken covalbumin epitope presented on murine Kb major histocompatability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         preparation of a medicine for the therapy of cancer or a vaccine for the prophylaxis of cancer. The cancer includes melanoma, kidney cancer, pulmonary carcinoma, hepatic carcinoma, mammary cancer, prostatic carcinoma, gastric carcinoma and leukaemia. This is the amino acid sequence of Ovalbumin (OVA) residues 257-264 used in the creation of Ovalbumin (OVA)-specific tetramers used in the vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an antigen-presenting cell (APC)/tumour cell conjugate, where the APC is modified by a cytokine gene (interleukin (IL-2, IL-3, IL-4, IL-1, IL-18, Interferon (IFN) alpha, IFNbeta, IFNgamma, tumour necrosis factor (TNP), transforming growth factor (TGF and/or granulocyte-macrophage colony stimulating factor (GM-CSF)). The antigen-presenting cell/tumour cell conjugate is useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antigen-presenting cell and tumor cell conjugates, where the antigen-presenting cell is modified by a cytokine gene, useful for the preparation of a medicine for the therapy of cancer or a vaccine for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a mutant form of B subunit of Escherichia CC coli heat labile enterotoxin (EtxB) or B subunit of cholera toxin (CtxB) CC from Vibrio cholerae which is useful for delivering an agent to a target CC cell, and has GM-1 ganglioside receptor binding activity but has reduced immunogenic and immunomodulatory activity relative to the wild-type form CC fixB or CtxB. Also described: (1) treating a disease or condition in CC a subject; (2) delivering the agent using the mutant to a target cell; (2) a composition; and (4) a kit for delivering the agent to a target cell; (CC ell. Mutant EtxB and CtxB have virucide and cytostatic activities and CC and be used in vaccines. The mutant can be used for the preparation of CC a medicament for delivering an exogenous peptide, which is the agent; (CC cinco the major histocompatibility complex (MHC) Class I antigen CC processing and presenting pathways to elicit a cytotoxic T lymphocyte (CTL) response, or for separate, simultaneous or combined use for treating viral infection or cancer. The mutant form of EtxB or CtxB creating viral infection or cancer. The mutant form of EtxB or CtxB cand immunomodulatory response. It may be linked with an agent to upregulate the presentation of the antigen or antigenic determinant. CC rhe present sequence represents a peptide which is used in an example

The invention relates to a method for enriching antigen-specific T lymphocytes, comprising contacting a heterogenous population of antigen-specific T lymphocytes with a matrix comprising MHC-antigen complexes for a period of time sufficient to allow the antigen-specific T lymphocytes to interact with the matrix, and eluting the antigen-specific T lymphocytes from the matrix to provide an enriched population of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   histocompatibility complex class I (H-2Kb)-restricted epitope of chicken ovalbumin. An example from the invention describes the generation of specific immune responses against this allergen-derived peptide using deoxyuridine monophosphate-modified oligonucleotide U-ODN 13 (see ABZ24776). U-ODN 13 is an example of new oligodeoxynucleic acid (ODN) molecules useful in the preparation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vaccines. The invention is based on the discovery that ODNs containing deoxyuridine residues have an immunostimulatory effect comparable to, or greater than, ODNs containing CDG motifs. Combining the ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a
                                                                                                                                      Enriching antigen-specific T lymphocytes, for purifying or expanding vitro tumour- or virus-specific killer T cells for cell therapy, comprises capture of the lymphocytes on a substrate coated with antigenic peptide-MHC complexes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 more antigens. Also claimed is a matrix for capturing antigen-specific T lymphocytes, comprising a support having on its surface an immobilised Class I peptide and a predetermined amount of an antigen, or for capturing antigens, comprising a support having on its surface an immobilised empty Class I peptide which is capable of binding one or more antigens, and isolating antigen-specific T lymphocytes from a heterogenous population of cells from a patient. The methods are useful for enriching antigen-specific T lymphocytes to purify and expand in vitro tunour- and virus-specific Xiller T cells for cell therapy. The methods are also useful for isolating or preparing a population of antigen-specific T lymphocytes from a patient for treatment of the patient's disease or condition. This sequence represents an MHC Class I peptide used in the method of the invention.
                                                                        acids involving contacting nucleic acids with a polycationic polymer in aqueous solution or suspension. The method can be used for the stabilisation of nucleic acid which can be used in medicines e.g. vaccinations, as a general immunostimicrolitresant, as an antisense drug
                                                                                                                                                                                                                                     WPI; 2003-140356/13
                                                                                                                                                                                                                                                                                                                                                                                                                28-NOV-2002

                                                                                         of TOP may be described as cytostatic and immunostimulatory. Thimet oligopeptides (TOP, EC3.4.25.15) plays a key role in modulating levels of major histocompatibility complex (MHC) class I-presented peptides. The recombinant host cell of the invention is useful for modulating an antigenic response in a mammal. Methods of the invention are useful for screening a test compound for its ability to serve as an immunomodulatory agent and identifying an antigen resistant to thimet oligopeptidase degradation. A method of the invention is useful for increasing CDB T-cell immunity, which uses vaccination with a TOP inhibitor for decreasing TOP expression or activity. The vaccination method uses treated tumour cells, antigen bearing/pulsed dendritic cells or injection of a viral vector. The recombinant host cell is useful for treating tumours. The current sequence represents an ovalbumin antigenic peptide
                                                                                                                                                                                                                                                                                                      The invention relates to a new recombinant cell comprising an exogenously derived nucleic acid that codes for a thimet oligopeptidase (TOP) polypeptide is overexpressed in the cell compared to a wild-type cell from which the recombinant cell is derived. The activity
                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant cell comprising an exogenously derived nucleic acid coding for a thimet oligopeptidase polypeptide, useful for modulating an antigenic response in a mammal for treating e.g., tumour -

The invention relates to selecting polynucleotides which encode antigen cc -specific immunoglobuline (Ig) (or fragments) comprising introducing into cappulation of host cells, a 1st and 2nd library of polynucleotides cc encoding, several 1st and 2nd Ig subunit polypeptides, permitting cc expression of Ig molecules (via control element e.g. an early/late cc promoter), contacting Ig molecules with an antigen, cc and recovering polynucleotides of the 1st library for the antigen. cc The Ig molecules are heavy and light chain constant regions and cc variable regions linked via peptide linkers and optionally directed via control element e.g. an early/late cc and recovering polynucleotides of the 1st library for the antigen. cc Also included is a method of selecting polynucleotides which encode a cc signal peptides or transmembrane domains to different cell compartments. cc Also included is a method of selecting polynucleotides which encode a cc signal peptide of into a population of eukaryotic host cells capable of cexpressing the Ig molecule a library of polynucleotides encoding cc (through operable association with a transcriptional control region) cc several single-domain Ig polypeptides (each comprising a Ig heavy chain constant region, a camelised Ig heavy chain variable region, and a cc signal peptide capable of directing cell surface expression of Ig collecules (or antigen-specific fragments); (b) permitting expression of Ig collecules which encode an antigen; and (d) recovering collecules which bind the antigens. The methods are useful for selecting cc polynucleotides which encode an antigen-specific Ig molecule, or its (MHC II), cytotoxic T-lyphocyte (CTL) epitope expressed on the surface of host cells used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selecting polynucleotides which encode antigen-specific immunoglobulin molecules, by introducing the library of polynucleotides into the host cells, and recovering the polynucleotides of the library for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Epitope; antigen-specific immunoglobulin; Ig; early/late promoter; heavy chain constant region; light chain constant region; variable region; camelised Ig heavy chain variable region; MHC; CTL; major histocompatibility class; cytotoxic T-lyphocyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ovalbumin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                04-FEB-2003

The peptides may be used therapeutically by administering the peptides to antient having a need to induce a directed CDB+ T cell response. The peptide may also be used as a preventive measure to avoid a disease or condition, or to treat subjects already afflicted with a disease. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a mutant form of B subunit of Escherichia C coli heat labile enterotoxin (EtxB) or B subunit of cholera toxin (CtxB) CC from Vibrio cholera which is useful for delivering an agent to a target cell, and has GM-1 ganglioside receptor binding activity but has reduced immunogenic and immunomodulatory activity relative to the wild-type form CC of EtxB or CtxB. Also described: (1) treating a disease or condition in CC a subject; (2) delivering the agent using the mutant to a target cell. Mutant EtxB and CtxB have virucide and cytostatic activities and CC can be used in vaccines. The mutant can be used for the preparation of CC a medicament for delivering an exogenous peptide, which is the agent, CC into the major histocompatibility complex (MHC) Class I antigen CC processing and presenting patthways to melicit a cytotoxic T lymphocyte (CTL) response, or for separate, simultaneous or combined use for C treating viral infection or cancer. The mutant form of EtxB or CtxB centers mammalian cells without inducing a potent anti-B-subunit response CC upregulate the presentation of the antigen or antigenic determinant. The present sequence represents a peptide which is used in an example crowntrion.
                                                                                                                                                                                                                                                                                                                                                                               Matches

The method for the production of activated CD8+ T cells specifically CC directed towards a particular antigen involves affixing peptides CC corresponding to the particular antigen to an artificial support; CC corresponding to the particular antigen to an artificial support; CC corresponding to the particular antigen to an artificial support; CC corresponding to the engulfed, and at least a portion of the peptides for the peptides for a time sufficient to be engulfed, and at least a portion of the peptides CC time sufficient to activate the unprimed CD8+ T cells. The present CC sequence represents a peptide designated OVA10N which corresponds to CC valbumin, a Kb-restricted peptide antigen. This represents the optimal CC speptide with the addition of two amino acids at the amino-terminus lowers the affinity of the CC small extensions to the optimal peptide affect the affinity to Kb by Cf-fold compared to the optimal peptide; addition of two amino acids to the carboxy-terminus lowers the affinity by 4-fold. The method, CC the carboxy-terminus lowers the affinity by 4-fold. The method, CC macrophages and artificial antigen presenting cell, having a peptide CC corresponding to the particular antigen present on its surface and at CC least a portion of an artificial support in its interior, can be used to treat conditions (e.g. cancer, tumours, neoplasia, viral or retroviral CC infection or autoimmune or autoimmune-type conditions) in patients via CC the specific killing of target cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          directed towards a particular antigen involves affixing peptides:

corresponding to the particular antigen involves affixing peptides:

contacting macrophages with the affixed peptides for a time sufficient for the peptides to be engulfed, and at least a portion of the peptides to be presented on the surface of the macrophage; and contacting unprimed CD8+ T cells with the peptide presenting macrophages for a time sufficient to activate the unprimed CD8+ T cells. The present sequence represents a peptide designated OVA10C which corresponds to ovalbumin, a Kb-restricted peptide antigen. This represents the optimal peptide with the addition of two amino acids at the carboxy-terminus.

Small extensions to the optimal peptide affect the affinity of the peptide for soluble class I molecules in vitro e.g. the addition of the optimal peptide; addition of two amino acids to the carboxy-terminus lowers the affinity to Kb by 76-fold compared to the optimal peptide; addition of two amino acids to the carboxy-terminus lowers the affinity by 4-fold. The method,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a pharmaceutical preparation comprising a comparied peptide, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SIINFEKL) (one compared to the wild type peptide. The neutral peptide (SIINFEKL) (one compared to the wild type peptide. The neutral peptide (INFEKL) (one compared to the wild type positively charged (Lys) amino acid) was respectively. Results showed that the addition of 4 negatively-compared amino acids (EDED) at the N-terminus of peptide SIINFEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (IFN)-gamma-producing T cells in the compared to the addition of hydrophobic amino acids say well as the addition of negatively charged amino acids transforms the peptide SINFEKL to a good inducer of specific T cells. The modified composition induce a stronger immune response in a mammal compared to wild type antigens. The present sequence represents modified ovalbumin-derived class I H-2Kb restricted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc modified peptide, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SIINPEKL) (one compared to the wild type peptide. The neutral peptide (SIINPEKL) (one compared to the wild type peptide. The neutral peptide (SIINPEKL) (one compared to the wild type peptide. The compared (Lys) amino acid) was cc rendered negative by adding (at the N-terminus) Glu Glu or Glu Asp Glu Asp, respectively. Results showed that the addition of 4 negatively-cc charged amino acids (EDED) at the N-terminus of peptide SIINFEKL makes this peptide (in combination with poly-L-arginine) able to induce a high camount of specific interferon (IFN)-gamma-producing T cells in the cc draining (popilteal) lymph node (local response) and in the spleen cc (systemic response). Thus, the addition of hydrophobic amino acids as the addition of negatively charged amino acids transforms the peptides of the pharmaceutical composition induce a stronger immune creponse in a mammal compared to wild type antigens. The present creponse in a mammal compared to wild type antigens. The present composition in the modified ovalbumin-derived class I H-2Kb restricted peptide #5 as described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                         modified peptide, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SINPEKL) (one compared to the wild type peptide. The neutral peptide (SINPEKL) (one compared to the wild type peptide. The neutral peptide (SINPEKL) (one compared to the wild type peptide. The sequence of the specific interferon (at the N-terminus) Glu Glu or Glu Asp Glu Asp, respectively. Results showed that the addition of 4 negatively. Charged amino acids (EDED) at the N-terminus of peptide SINPEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (IFN)-gamma-producing T cells in the CC amount of specific interferon (IFN)-gamma-producing T cells in the CC systemic response). Thus, the addition of hydrophobic amino acids as compared to wild type antigens. The present the peptides of the pharmaceutical composition induces a stronger immune cresponse in a mammal compared to wild type antigens. The present composition induces a stronger immune compared to wild type antigens. The present compared to wild type antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein which can be obtained from either an LSTRA or EL-4 tumour of Balb/c mice. The peptides bind to MHC class I molecules. This is useful for tissue typing or for screening for molecules that interact with MHC class I molecules. MHC class I molecules can be identified using the peptides and also the peptides are useful in vaccines against disease and infection e.g. caused by viruses, bacteria or tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ovalbumin-derived class I H-2Kb restricted peptide; vaccine; immunostimulant; immunogenic; interferon-gamma-producing T cell; IFN; popliteal lymph node; spleen; immune response; systemic response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a pharmaceutical preparation comprising

                                                                                                                                                           rendered negative by adding (at the N-terminus) Glu Glu or Glu Asp Glu Asp, respectively. Results showed that the addition of 4 negatively-charged amino acids (EDED) at the N-terminus of peptide SINNEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (IFN)-gamma-producing T cells in the draining (popliteal) lymph node (local response) and in the spleen (systemic response). Thus, the addition of hydrophobic amino acids as well as the addition of negatively charged amino acids transforms the peptides of the pharmaceutical composition induce a stronger immune response in a mammal compared to wild type antigens. The present sequence represents modified ovalbumin-derived class I H-2Kb restricted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ovalbumin-derived class I H-2Kb restricted peptide; vaccine; immunostimulant; immunogenic; interferon-gamma-producing T cell; IFN; popliteal lymph node; spleen; immune response; systemic response.
                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                             The invention relates to a pharmaceutical preparation comprising a modified peptide, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SIINFEKL) (one negatively charged (Glu), one positively charged (Lyg) amino acid) was
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical preparation for use as a potent vaccine for inducing improved immune response in a mammal, comprises a modified peptide

                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                           The invention relates to a pharmaceutical preparation comprising a comparied, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SIINFEKL) (one negatively charged (Glu), one positively charged (Lys) amino acid) was respectively. Results showed that the addition of 4 negatively-charged amino acids (BDED) at the N-terminus of peptide SIINFEKL and the addition of 4 negatively-charged amino acids (BDED) at the N-terminus of peptide SIINFEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (IFN)-gamma-producing T cells in the C amount of specific interferon (IFN)-gamma-producing T cells in the C draining (popliteal) lymph node (local response) and in the spleen (systemic response). Thus, the addition of hydrophobic amino acids as well as the addition of negatively charged amino acids transforms the peptide SINNEKL to a good inducer of specific T cells. The modified peptides of the pharmaceutical composition induce a stronger immune response in a mammal compared to wild type antigens. The present sequence represents modified ovalbumin-derived class I H-2Kb restricted

                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                  to the surface of 3 myeloid cell lines of moved the well as to human neutrophils, was mainly mediated through the CD11b/CD18 integrin. The invention relates to the novel use of Bordetella CyaA as a proteinaceous vector for targetting a molecule of interest to the surface CD11b-expressing cells, especially dendritic cells and neutrophils. The molecule of interest is translocated in the cycosol to prime a cyctoxic T lymphocyte response. In a preferred embodiment, a peptide is inserted into in the catalytic domain of CyaA at a permissive site. The peptide may be an intracellular bacterial cell, tumour, viral, fungal or parasite cell antigen (all claimed). Alternatively, a fungal or parasite cell antigen (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a peptide that was introduced into the catalytic domain of a detoxified form of the adenylate cyclase (CyaA, or adenylcyclase) of Bordetella pertussis. A recombinant detoxified CyaA toxin, CACTES-Cys-Ova, harbouring a unique cysteine that was derived from the peptide insert, was produced. The

The neutral peptide (SIINFEKL) (one compared to the wild type peptide. The neutral peptide (SIINFEKL) (one compared to the wild type peptide. The neutral peptide (SIINFEKL) (one compared to the wild type peptide. The neutral peptide (SIINFEKL) (one compared to the wild type positively charged (Lys) amino acid) was createred negative by adding (at the N-terminus) Glu Glu or Glu Asp Glu Asp, respectively. Results showed that the addition of 4 negatively-charged amino acids (EDED) at the N-terminus of peptide SIINFEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (IFN)-gamma-producing T cells in the Graining (popliteal) lymph node (local response) and in the spleen (eystemic response). Thus, the addition of hydrophobic amino acids as well as the addition of negatively charged amino acids transforms the peptide SIINFEKL to a good inducer of specific T cells. The modified response in a mammal compared to wild type antigens. The present sequence represents modified ovalbumin-derived class I H-2Kb restricted comparide #3 as described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        á
                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 87
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified peptide, which induces an improved immune response in a mammal compared to the wild type peptide. The neutral peptide (SIINPEKL) (one negatively charged (Glu), one positively charged (Lys) amino acid) was rendered negative by adding (at the N-terminus) Glu Glu or Glu Asp Glu Asp, respectively. Results showed that the addition of 4 negatively-charged amino acids (EDE) at the N-terminus of peptide SIINPEKL makes this peptide (in combination with poly-L-arginine) able to induce a high amount of specific interferon (IFN)-gamma-producing T cells in the draining (popliteal) lymph node (local response) and in the spleen (systemic response). Thus, the addition of hydrophobic amino acids as well as the addition of negatively charged amino acids transforms the peptide SIINPEKL to a good inducer of specific T cells. The modified peptides of the pharmaceutical composition induce a stronger immune response in a mammal compared to wild type antigens. The present gequence represents modified ovalbumin-derived class I H-2Kb restricted peptide #8 as described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Compared to the wild type peptide. The neutral preparation comprising a compared to the wild type peptide. The neutral peptide (SIINFEKL) (one negatively charged (Glu), one positively charged (Lys) amino acid) was compared megative by adding (at the N-terminus) Glu Glu or Glu Asp Glu Coharged amino acids (EDED) at the N-terminus of peptide SIINFEKL makes this peptide (in combination with poly-L-arginine) able to induce a high caraining (popliteal) lymph node (local response) and in the spleen constituent response). Thus, the addition of holds and in the spleen constituent of negatively charged amino acids the addition of negatively charged amino acids as the addition of negatively charged amino acids transforms the peptide SIINFEKL to a good inducer of specific T cells. The modified composition is the addition of hydrophobic amino acids as the peptide SIINFEKL to a good inducer of specific T cells. The modified composition induce a stronger immune compared to wild type antigens. The present composes in a mammal compared to wild type antigens. The present composition induce class I H-2Kb restricted peptide #4 as described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             improved immune response in a mammal, comprises a modified peptide

Use of a mutant form of B subunit of Escherichia coli heat labile enterotoxin or B subunit of cholera toxin for delivering an agent to target cell for treating viral infection or cancer  $\,$ 

5 Page 45; 84pp; English.

The present invention describes a mutant coli heat labile enterotoxin (EtxB) or B from Vibrio cholerae which is useful for form of B subunit of Escherichia subunit of cholera toxin (CtxB) delivering an agent to a target

Also described: (1) treating a disease or condition in a subject; (2) delivering the agent using the mutant to a target cell; (3) a composition; and (4) a kit for delivering the agent to a target cell. Mutant EtxB and CtxB have virucide and cytostatic activities and can be used in vaccines. The mutant can be used for the preparation of a medicament for delivering an exogenous peptide, which is the agent, into the major histocompatibility complex (MHC) Class I antigen processing and presenting pathways to elicit a cytotoxic T lymphocyte (CTL) response, or for separate, simultaneous or combined use for treating viral infection or cancer. The mutant form of EtxB or CtxB entered managements and the state of the processing viral infection or cancer. The mutant form of EtxB or CtxB entered managements and the content of the combined was content to the content of the con

                                                                                                The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (HHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards treatment or prevention of infectious diseases and malignancies. The present sequence is chicken MHC class I peptide antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatability complex; MHC; therapy; immune response; malignancy; chicken.

                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                     RESULT 94
                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                immunogenic and immunomodulatory activity relative to the wild-type form CC of EtxB or CtxB. Also described: (1) treating a disease or condition in CC a subject; (2) delivering the agent using the mutant to a target cell; (2) a composition; and (4) a kit for delivering the agent to a target cell. Mutant EtxB and CtxB have virucide and cytostatic activities and CC can be used in vaccines. The mutant can be used for the preparation of a medicament for delivering an exogenous peptide, which is the agent, controlled in the major histocompatibility complex (MHC) Class I antigen processing and presenting pathways to elicit a cytotoxic T lymphocyte (CTL) response, or for separate, simultaneous or combined use for treating viral infection or cancer. The mutant form of EtxB or CtxB enters mammalian cells without inducing a potent anti-B-subunit response and immunomodulatory response. It may be linked with an agent to upregulate the presentation of the antigen or antigenic determinant. The present sequence represents a peptide which is used in an example
                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                    Carbone and Bevan demonstrated that cytotoxic T-lymphocyte (CTL) induced in C57BL/6 mice by EG7-ova transfectant, and by cytoplasmically ova-loaded splenocytes recognise EL4 cells coated with the peptide ova 258-276. To determine whether soluble ovalbumin in AF induces similar CTL responses, spleen cells were prepared from immunised mice and stimulated in vitro with EG7-ova. The effectors were tested against El4 cells coated with the peptide ova 253-276 or with a control peptide derived from myelin basic protein (MBP 84-102). The results demonstrate that ova-AF primed CTL with a similar specificity to those primed by transfectants, or by cytoplasmically

This provides a means of producing, loading and using Class I MHC molecules to specifically activate CD8 cells in vitro. Activated cells can be used to specifically kill target cells and also to treat cancer as well as viral, retroviral, autoimmune and autoimmune-type diseases. When conjugated to a toxin, empty human MHC molecules expressed by the cells can be used to inhibit transplant rejection. A number of antigenic peptides (AAR41450-R41463) are synthesised to be bound by the MHC molecules and this binding can then activate the CD8 cells. (Updated on 25-MAR-2003 to correct PN field.)
                                 Prodn. of activated CD8+ T cells direc specifically kill target cells useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The method for the production of activated CD8+ T cells specifically CC directed towards a particular antigen involves affixing peptides CC corresponding to the particular antigen to an artificial support; CC contacting macrophages with the affixed peptides for a time sufficient CC for the peptides to be engulfed, and at least a portion of the peptides CC to be presented on the surface of the macrophage; and contacting CC unprimed CD8+ T cells with the peptide presenting macrophages for a CC time sufficient to activate the unprimed CD8+ T cells. The present CC sequence represents a peptide designated OVA24 which corresponds to CC valbumin, a KD-restricted peptide antigen. This is not as efficient as CC ovalbumin, a KD-restricted peptide antigen. This is not as efficient as the optimal peptide. The method, macrophages and artificial antigen CC presenting cell, having a peptide corresponding to the particular CC support in its interior, can be used to treat conditions (e.g. cancer, cumours, neoplasia, viral or retroviral infection or autoimmune or CC autoimmune-type conditions) in patients via the specific killing of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                           The present invention relates to a method of treating viral, parasitic and bacterial infections and cancer in humans, by administering an antigen which causes a cytotoxic T-lymphocyte response. Said antigen does not contain an immunostimulatory element. The method can also be used in domesticated animals. The present sequence is a peptide used as an antigen in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytotoxic T lymphocyte response; CTL; antigen; viral infection; bacterial infection; cancer; parasitic infection; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ovalbumin based peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAG65170 standard; peptide;

                                                                                                                                                    Sequence
                                                                                                                                                                              The present invention describes a method of treating a papillomavirus-related tumour, involving administering an antigen formulation capable of inducing a cytotoxic T-lymphocyte (CTL) response specific to the papillomavirus antigen in the individual. This is useful in the treatment of cancer and infections, such as those due to HIV, bacteria, parasites, influenza, herpes virus and hepatitis viruses. The present sequence is a peptide used to demonstrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising an antigen mixed with microfluidised antigen formulation comprising a stabilised detergent, a micelle-forming agent and a biodegradable/biocompatible oil. The composition is formulated as a stable oil-in-water emulsion substantially free of or lacking immunostimulating peptides, and is capable of inducing specific cytotoxic T lymphocyte response against antigens in vivo. The
                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                            and inducing cytotoxic T lymphocyte response in a patient e.g. human, domesticated animal or agricultural animal. This sequence represents an ovalbumin (OVA) peptide fragment used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition useful for inducing cytotoxic T lymphocyte response in domesticated animals and humans comprises antigen mixed with microfluidised antigen formulation which is substantially free of

                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                     The present invention describes a mutant form of B subunit of Escherichia CC coli heat labile enterotoxin (ExB) or B subunit of cholera toxin (CtxB) CC from vibrio cholera e which is useful for delivering an agent to a target cell, and has GM-1 ganglioside receptor binding activity but has reduced CC immunogenic and immunomodulatory activity relative to the wild-type form CC of ExB or CtxB. Also described: (1) treating a disease or condition in CC a subject; (2) delivering the agent using the mutant to a target cell; (C (3) a composition; and (4) a kit for delivering the agent to a target cell; (C (3) a composition; and CtxB have virucide and cytostatic activities and Cc a medicament for delivering an exogenous peptide, which is the agent, CC into the major histocompatibility complex (MRC) class I antigen CC into the major histocompatibility complex (MRC) class I antigen CC (CTL) response, or for separate, simultaneous or combined use for treating viral infection or cancer. The mutant form of EtxB or CtxB centers mammalian cells without inducing a potent anti-B-subunit response and immunomodulatory response. It may be linked with an agent to CC upregulate the presentation of the antigen or antigenic determinant. CC from the present invention.
                                                                                                                                                                                                                                                             Matches

                                                                                                                         The present invention describes a mutant form of B subunit of Escherichia CC coli heat labile enterotoxin (ExxB) or B subunit of cholera toxin (CtxB) cf from Vibrio cholerae which is useful for delivering an agent to a target cell, and has GM-1 ganglioside receptor binding activity but has reduced immunogenic and immunomodulatory activity relative to the wild-type form CC of EtxB or CtxB. Also described: (1) treating a disease or condition in CC a subject; (2) delivering the agent using the mutant to a target cell; (3) a composition; and (4) a kit for delivering the agent to a target cell; (2) a composition; and (4) a kit for delivering the agent to a target cell; (3) a composition; and (4) a kit for delivering the agent to a target cell; (2) a medicament for delivering an exogenous peptide, which is the agent, into the major histocompatibility complex (MHC) Class I antigen CC into the major histocompatibility complex (MHC) Class I antigen (CTL) response, or for separate, simultaneous or combined use for treating viral infection or cancer. The mutant form of EtxB or CtxB centers mammalian cells without industring a notation of EtxB.

                                                                                                                                                                                                                                                                                                                                             The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major instocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken MHC class I peptide antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Key

```
immunogenic and immunomodulatory activity relative to the wild-type form of EtxB or CtxB. Also described: (1) treating a disease or condition in a subject; (2) delivering the agent using the mutant to a target cell; (3) a composition; and (4) a kit for delivering the agent to a target cell. Mutant EtxB and CtxB have virucide and cytostatic activities and can be used in vaccines. The mutant can be used for the preparation of a medicament for delivering an exogenous peptide, which is the agent, into the major histocompatibility complex (MHC) Class I antigen processing and presenting pathways to elicit a cytotoxic T lymphocyte (CTL) response, or for separate, simultaneous or combined use for treating viral infection or cancer. The mutant form of EtxB or CtxB
                                                           enters mammalian cells without inducing a potent anti-B-subunit response and immunomodulatory response. It may be linked with an agent to upregulate the presentation of the antigen or antigenic determinant. The present sequence represents a peptide which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a mutant form of B subunit of Escherichia coli heat labile enterotoxin (ExB) or B subunit of cholera toxin (CtxB) from Vibrio cholerae which is useful for delivering an agent to a target cell, and has GM-1 ganglioside receptor binding activity but has reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of a mutant form of B subunit of Escherichia coli heat labile enterotoxin or B subunit of cholera toxin for delivering an agent target cell for treating viral infection or cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The method for the production of activated CD8+ T cells specifically chirected towards a particular antigen involves affixing peptides corresponding to the particular antigen to an artificial support; contacting macrophages with the affixed peptides for a time sufficient for the peptides to be engulfed, and at least a portion of the peptides to be presented on the surface of the macrophage; and contacting cumprimed CD8+ T cells with the peptide presenting macrophages for a time sufficient to activate the unprimed CD8+ T cells. The present sequence represents a peptide designated OVA15 which corresponds to covalbunin, a Kb-restricted peptide antigen. This is not as efficient as the optimal peptide. The method, macrophages and artificial antigen corresponding to the particular contistent peptide corresponding to the particular contistent in its interior, can be used to treat conditions (e.g. cancer, tumours, neoplasia, viral or retroviral infection or autoclumnue or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC acids, polyniclectides, or its combination, an antigen to be targeted to carrier is useful for delivering an expression vector containing a cells expressing GBJ receptor. The universal polypeptidic carrier is useful for delivering an expression vector containing a compression vector containing a compression vector to a lysine-rich peptide compression vector to a lysine-rich peptide compression vector to a lysine-rich peptide contently linked to the Cys molety of the universal polypeptidic covalently linked to the Cys molety of the universal polypeptidic covalently linked to the Cys molety of the universal polypeptidic covalently linked to the Cys molety of the universal polypeptidic covalently linked to the Cys molety of the universal polypeptidic covalently as sequence encoding an immunogenic competitie, or a sequence encoding a pro-drug becoming toxic for the GBJ receptor expressing very personal polypeptidic carrier is useful for targeting a molecule to a GBJ receptor expressed in the cell completely on the cell completely of the universal polypeptidic carrier is useful constrained and constrained and constrained to the universal polypeptidic carrier is useful constrained and constrained the cell constrained and constrai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel universal polypeptidic carrier for targeting a molecule directly or indirectly to Gb3 receptor expressing cells, useful for directing cytotoxic drugs to tumor cells expressing Gb3 receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proteins, peptides, oligopeptides, glycoproteins, glycopepacids, polynucleotides, or its combination, an antigen to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a universal polypeptidic carrier for target directly or indirectly a molecule to Gb3 receptor expressing cells. universal polypeptidic carrier is useful for targeting directly or indirectly, to Gb3 receptor expressing cells, using molecules such a indirectly, to Gb3 receptor expressing cells, using molecules such a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 3; Page 8; 24pp; English.

The peptides may be used therapeutically by administraring the peptides to a patient having a need to induce a directed CDB+ T cell response. The peptide may also be used as a preventive measure to avoid a disease or condition, or to treat subjects already afflicted with a disease. The present sequence represents a peptide of the invention.
                                                                                             The specification describes a peptide variant of lemA, comprising a hydrophobic element joined to a CD8+ epitope.                                                                                                                                                                                                                                                                                                                                            The specification describes a peptide variant of lemA, comprising a hydrophobic element joined to a CDB+ epitope. The peptides may be used theraspeutically by administering the peptides to a parient having a need to induce a directed CDB+ T cell response. The peptide may also be used as a preventive measure to avoid a disease or condition, or to treat subjects already affilicted with a disease. The present sequence represents a peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            `

CC between a 5' recombining site and a 3' recombining site (e.g., loxper ceither 5' of the 5' recombining site or 3' of the 3' recombining site; CC and insertion ends comprising an inverted repeat sequence at the 5' and 3' ends of the transposable element sufficient for integration of the CC transposable element. The transposable elements of the invention are able to intracellular bacterial pathogen. This system "tegs" the bacterial gene cand resulting protein, allowing the identification of proteins secreted across the membranes of the eukaryotic cell infected by the bacterium. In one embodiment, the transposable elements contain an CC antibiotic resistance cassette, two minimal loxp recombination sites, an CC transposase, such as the Cre recombinate protein, is expressed in transposable element. The Cre recombinate of the intervening sequences containing the antibiotic resolved insertion places the MHC class I or class I epitope and flanking insertion ends. A CC transposable of seathogen, such as slamonella sp., Mycobacterium tinserts within a gene, the transposable element inserts within a gene, containing the antibiotic resolved insertion places the MHC class I or class II epitope in a natigenic epitope of an intracellular bacterial pathogen, such as Salmonella sp., Mycobacterium tuberculosis and Listeria contains involved in bacterial pathogenes of the transposable element of the invention of the understall pathogen such as Salmonella sp., wycobacterium tuberculosis and Listeria contains involved in bacterial pathogenes is to that such proteins can be used as vaccine and drug targets. Carrier vaccines may be generated by infecting bacteria with a transposable element of the invention of contains of the transposable element of the invention are protein of the transposable element. The present sequence containing fusion protein contents of the transposable element. The present sequence content in the protein protein contents of the transposable element. The present sequence content in the protein protein con

The invention relates to a novel transposable element comprising DNA composition as selectable marker (e.g., antibiotic resistance) located composition as 5' recombining site and a 3' recombining site (e.g., loxpective) and insertion ends comprising an inverted repeat sequence at the 5' and insertion ends comprising an inverted repeat sequence at the 5' and combining site or 3' of the 3' recombining site; and insertion ends comprising an inverted repeat sequence at the 5' and combining site; and insertion ends of the transposable element sufficient for integration of the combining site; and combining site; and combining site; and combined the interdece in frame insertions throughout the chromosome of an intracellular bacterial pathogen. This system "tags" the bacterial gene combinated across the membranes of the eukaryotic cell infected by the secreted across the membranes of the eukaryotic cell infected by the secreted across the membranes of the eukaryotic cell infected by the combinated across the membranes of the eukaryotic cell infected by the secreted across the membranes of the endation of proteins and combinated in case of the endation sites, and combined to case the combinate protein, is expressed in transposable element. The Cre recombinase protein, is expressed in transposable element. The Cre resistance cassette. When the transposable element inserts within a gene, the resolved insertion places the MHC class I or class II epitope in companies of the transposable element. The cre resistance cassette epitope of an intracellular bacterial manocytogenes. Certain embodiments of the technology, termed monocytogenes. Certain embodiments of the technology, termed monocytogenes, such as Salmonella sp., Mycobacterium tuberculosis and Listeria monocytogenes, such as salmonella sp., by cobacterium tuberculosis and Listeria monocytogenes, such as salmonella sp., by cobacterium tuberculosis and tisteria monocytogenes, such as sold pathology, termed to the transposable element of the invention of class II epitope 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transposable element; MHC epitope; major histocompatibility complex; intracellular bacterial pathogen; loxP site; Cre recombinase; insertion end; in-frame fusion; detection; antigen; disseminated insertions of class-I epitopes; DICE-I; transposon Tn5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transposable element for detecting an antigenic epitope of a pathogen, comprising 5' and 3' recombining sites, nucleic acid sequences encoding a selectable marker and major histocompatibility complex (MHC) epitope, and an insertion end -
which additionally comprises an antigen associated with a disease, preferably cancer or a viral or bacterial disease, operably linked to the MHC epitope DNA of the transposable element. The present sequence represents an ovalbumin MHC class I epitope-containing fusion protein encoded by the resolved sequence of a DICE-I transposable element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                26-MAY-2000; 2000WO-US14687.

                                                                                                                The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The

                                                                                                                     The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain.
                                                                                                                                                                                                                                                                          A new antigenic complex comprising epitopes non-covalently joined heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy
                                                                                                 Sequence

                                                                                                                                                         The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the creatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain.

                                                                                                                                                                                                                                                                                                   The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain.

This sequence contains 10 murine cytotoxic T lymphocyte (CTL) epitopes. Each of the epitopes in this sequence are capable of producing a primary CTL response in mice with the appropriate major histocompatability complex (MHC) allele. This sequence (and the DNA encoding it) can be used in vaccines against multiple epitopes derived from several different pathogens. The vaccine could alternatively contain a large number of epitopes from one pathogen so that HLA diversity of the target population is covered. The vaccines can be delivered by vaccinia virus, avpox virus, bacterial or rhabdovirus vectors, or by virus-like particles. The proteins are preferably administered with ISCOMS when they are delivered directly.
                                                                                                                                                                                                                                                                                                                                                   Gallus gallus.

The antigenic complex is used to induce immune responses directed towards t treatment or prevention of infectious diseases and malignancies. The
A new antigenic complex comprising epitopes non-covalently joined heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy -
                                                                                                                                                                                                                                                     Region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. T antigenic complex is used to induce immune responses directed towards treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric; pan DR epitope; expression vector; promoter; major histocompatibility complex; MHC; targetting; pej promoter; major histocompatibility complex; MHC; targetthway; epitope; antigen; presentation; class II; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytotoxic T lymphocyte; CTU; immune response; immunogenicity; at cytotoxic immunity; infection; pathogen; virus; HTV; HTV; HTV; because in the baselities.
This sequence represents the amino acid sequence of the AOS minigene insert of the expression vector pMIN.0 (AAZ38634). This insert encode several MHC class I epitopes, and also the universal MHC class II (helper T) epitope, pan DR epitope (PADRE), and was used
                                                                                                                                                                                                                                                                                                                                                                                                Synthetic.

The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II consider the pathway to be processed into antigen peptides for presentation on MHC class II consider the periope to a cytotoxic I lymphocyte (HTL) epitopes, or a cytotoxic I lymphocyte (CTL) epitopes and a cytotoxic I lymphocyte (CTL) epitope and a nuversal HTL epitopes, or a cytotoxic I lymphocyte (CTL) epitope and a nucleit as for use in assaying the human immunogenicity of a human T cell peptide epitope in vivo in a non-human mammal. They provide a nucleic acid vaccine for CTL enhancing immunity against infectious pathogens, such as viruses (e.g., CTL) epitopes in a cytotoxic I lymphocyte (e.g., CTL) epitopes and also tumour cells and CTL autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the CTL provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The present sequence represents an ovalbumin protein. Ovalbumin was fus to a heat shock protein (Hsp), and used used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Thi-like response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the THI-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The

                                           immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER300 CGM-CSF fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 membrane distal extracellular domain, an Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, an Ala linker, a HER-2 membrane distal intracellular domain, a mature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          dendritic cell; colon cancer; breast carcinoma; ovarian cancer; PAP protein; Ala Arg linker; membrane distal extracellular domain; membrane distal intracellular domain; C-terminal tag; human; GM-CSF; HER-2 protein; granulocyte-macrophage colony stimulating factor; ovalbumin-derived octapeptide; OVA; rat; HER300-rGM-CSF fusion protein.
                                                                                                                                                                                The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such such ins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC) induced T-cell mediated cellular
                                                                                                                                                                                                                                                                                                                          An immunostimulatory fusion protein comprising the intracellular domain of HER-2 and an antigen elicits an immune response to the antigen and is useful for the treatment of associated cancer associated -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-MAR-2000; 2000US-193504P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-MAR-2001; 2001WO-US10515
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric - Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    So
         The present invention relates to a new mutant major histocompatibility (CC complex (MHC) class I chimeric protein. The protein of the invention (CC comprises a portion mediating binding to surfaces of recombinant yeast (CC cells and a portion comprising peptide binding region of MHC class I (CC protein, where the invention is improved in stability as compared with (CC MHC class I Chimeric protein which is not a mutant chimeric protein. (CC The protein, further comprising a detectable label, is useful for (CC detecting a lymphocyte having a T-cell receptor protein in a biological sample such as cells, itssue sample, biopsy material or bodily fluids. (CC The method is useful for detecting a Tlymphocyte that is specific for (CC infected cell, a tumour cell, a virus-infected cell, a protozoan-(CC infected cell, a bacterium-infected cell or a fungus-infected cell. The (CC infected cell, a bacterium-infected cell or a fungus-infected cell. The (CC infected cell, a protozoan-(CC infected cell), a protozoan-(CC infected cell)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                    immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER-2 membrane distal extracellular domain, an Ala linker, an ovalbumin (OVA) derived immunodominant octapeptide, HER-2 membrane distal intracellular domain and a C-terminal tag.
                                                                                                                                                                                                            The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunostimulatory fusion protein; IFP; antigen component; therapy; immunostimulatory component; T-cell mediated immune response; DC; dendritic cell; colon cancer; breast carcinoma; ovarian cancer; PAP protein; Ala Arg linker; membrane distal extracellular domain; membrane distal intracellular domain; C-terminal tag; human; OVA;
                                                                                                                                                                                                                                                                                                        Claim 7; Page 26; 59pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
Ś
                               The invention relates to immunostimulatory fusion proteins (IFP) and CC nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived cfrom the intracellular domain of HER-2 protein which is effective to celicit a protective dendritic cell (DC)-induced T-cell mediated cellular cimmune response to the antigen. IFP or superactivated dendritic cells cC are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer cassociated with a particularly antigen. The present sequence is HER500 CC rGM-CSF fusion protein construct which comprises human PAP csignal sequence, mature PAP protein, an Ala Arg linker, human HER-2 csignal sequence, mature PAP protein, an Ala Arg linker, human HER-2 csignal sequence, mature PAP membrane distal extracellular domain, CC an Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, CC signal sequence distal intracellular domain, an Ala Ala linker, a mature CC HER-2 membrane distal intracellular domain, an Ala Ala linker, a mature can granulocyte-macrophage colony stimulating factor (GM-CSF) sequence cc and a C-terminal tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunostimulatory fusion protein; IFP; antigen component; therapy; immunostimulatory component; T-cell mediated immune response; DC; dendrittic cell; colon cancer; breast carcinoma; ovarian cancer; and protein; Ala Arg linker; membrane distal extracellular domain; membrane distal intracellular domain; C-terminal tag; human; GM-CSF; HER-2 protein; granulocyte-macrophage colony stimulating factor; ovalbumin-derived octapeptide; OVA; rat; HER500-rGM-CSF fusion protein.

                                                                                                                                                                                                                      The present sequence represents a fusion protein comprising a Wycobacterium bovis heat shock protein (Hsp) 65 fused at its C terminal to an ovalbumin protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

                          cells. They can also be used e.g. to treat hypertension (angiotensin-based LD); to increase levels of luteinising hormone (LH), using LD derived from LH-releasing hormone, or to promote skin tanning (LD based on alpha -melanocyte-stimulating hormone, MSH). The bivalent agonists are administered orally, by injection or topically. Typical doses for skin tanning are 1-4000 (especially 30-100) mu mole/kg systemically or the bivalent agonists are administered topically in a composition containing 0.001-10 (especially 1) mM. Where both LD are agonists, the bivalent agonist has a synergistically higher activity than two individual agonist ligands, and where at least 1 is an antagonist the effect is stimulatory. The bivalent agonists are active at lower concentrations than known agonists so should avoid toxicity problems.
                                                                                                                                                                                                                                                                This sequence represents one of two identical chains disulphide bonded to form a bombesin dimer. The invention relates to bivalent agonists, with affinity for at least 1 G-protein coupled receptor (GPCR). The bivalent agonists comprise: (a) two ligand domains (LD), individually agonists or antagonists for GPCR, spaced 40-250 Angstrom apart, and (b) a molecular backbone (MB) covalently bound to LD. The bivalent agonists are useful in human or veterinary medicine as carriers for drugs or gene
                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 41; Page
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bivalent agonist of G-protein coupled receptors containing two ligand domains - bonded to molecular backbone, for treatment of hypotension, promotion of skin tanning etc., also for deliverifulges and gene therapy vectors to selected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        G-protein

The present invention relates to compositions of modified soluble protein antigens capable of eliciting an enhanced in vivo cytotoxic T cell (CTL) response i.e. a major histocompatability complex (MHC) class I molecule response. The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is one such peptide sequence which can be used to modify the soluble antigens. The present sequence is peptide pK. The modified antigen composition may be used for immunising against, or treating a tumour e.g. prostate and breast carcinoma or multiple myeloma, or pathogen in mammals. Claim 2; Antigens modified by the covalent addition of a peptide that facilitates entry into antigen presenting cells, useful for compositions for immunizing against tumors and pathogens pk peptide; cytostatic; vaccine; cytotoxic T cell; CTL; immunotherapy; major histocompatibility complex class 1; MHC class 1; antigen; tumour; WPI; 2000-442365/38 Laus R, 14-DEC-1998; 14-DEC-1999; 22-JUN-2000 WO200035949-A1 Unidentified. prostate; breast; Soluble peptide antigen pK 10-NOV-2000 AAB13780; (DEND-) DENDREON CORP. 08-NOV-2000
The present invention relates to the isolation of novel DNA-binding proteins, and cDNA (AAS2903)-AAS29157) and genomic sequences encoding for these proteins. DNA-binding proteins such as histones, chromo (chromatin organisation modifier) domain proteins, and y-box binding proteins may contribute to diseases resulting from aberrant DNA organisation and/or gene transcription. The sequences of the invention are useful in screening assays to identify antagonists and/or agonists that may enhance or block activities mediated by DNA-binding proteins. Blockers of DNA-binding proteins may be useful in treating disorders such as malignant diseases (e.g. cancer), autoimmune disorders (e.g. diabetes mellitus), rheumatic diseases (e.g. rheumatoid arthritis), genetic abnormalities (e.g. cystic fibrosis), infectious diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's

                                                                                                            the encoded proteins (AAO00010-ÂAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease). The polynucleotide sequences of the invention may also be used in gene therapy. AAU18154-AAU18281 represent novel DNA-binding

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune
